

# Fire protection of offshore installations with INERGEN® extinguishing agent

## INERGEN®

Protects human lives, property and the environment

- ← Efficient extinguishing
- ← 3D extinguishing effect
- ← Compact solution
- ← Prevents secondary damage

### Protecting your special application

Many special applications in the world need fire protection and Fire Eater is an expert on protecting against fire. At large/small museums, heritage buildings, wind mills, special production facilities and other locations where water mist or other extinguishing is not the right solution, we at Fire Eater have INERGEN® – the right solution. INERGEN® is safe for people, extinguishes automatically and secures that you can resume activities immediately after the discharge.

Fire in a historical building with invaluable interior, old wall-paper or books, could involve huge financial and material losses – and worse, injury to people. The right extinguishing system must safeguard your special application against fire. INERGEN® provides that safeguard.

### Why use INERGEN®?

- Extinguishes fire quickly
- Puts out fires for good
- Prevents secondary damage.

### Fast extinguishing

An INERGEN® system combined with the right detection responds quickly to the fire. As soon as a fire is detected, the INERGEN® gas disperses quickly and effectively, reducing oxygen levels and extinguishing the fire.

### Effective and permanent

A fire at your special application can be disastrous. The right fire extinguishing solution can save lives and protect your equipment. INERGEN® systems limit fire damage, keeping downtime and clean-up time to a minimum.

### Prevents overheating

The primary cause of fires are often overheated installations. When released, INERGEN® lowers the room temperature and reduces the oxygen level, preventing overheating and reignition.
