

Fire protection of offshore installations

with INERGEN® extinguishing agent

INERGEN®

Protects human lives, property and the environment

- ← Efficient extinguishing
- ← 3D extinguishing effect
- ← Compact solution
- ← Prevents secondary damage

Protect power plants against fire

Why fire protection is mandatory in power stations and other generating plants needs no explanation. It is essential to safeguard such public utilities from fire.

Fire in a power station can result in huge financial and material losses, disruption of service – and worse, injury to people.

The right fire extinguishing system must safeguard your power plant against fire. INERGEN® provides that safeguard.

Why use INERGEN®?

- Extinguishes fire quickly
- Puts out fires for good
- Harmless to people and equipment
- Prevents secondary damage.

Fast extinguishing

INERGEN® systems respond to fire – fast. As soon as a fire is detected, the INERGEN® gas disperses quickly and effectively, reducing oxygen levels and extinguishing the fire - unlike CO2 systems there is no reason to hesitate.

Effective and permanent

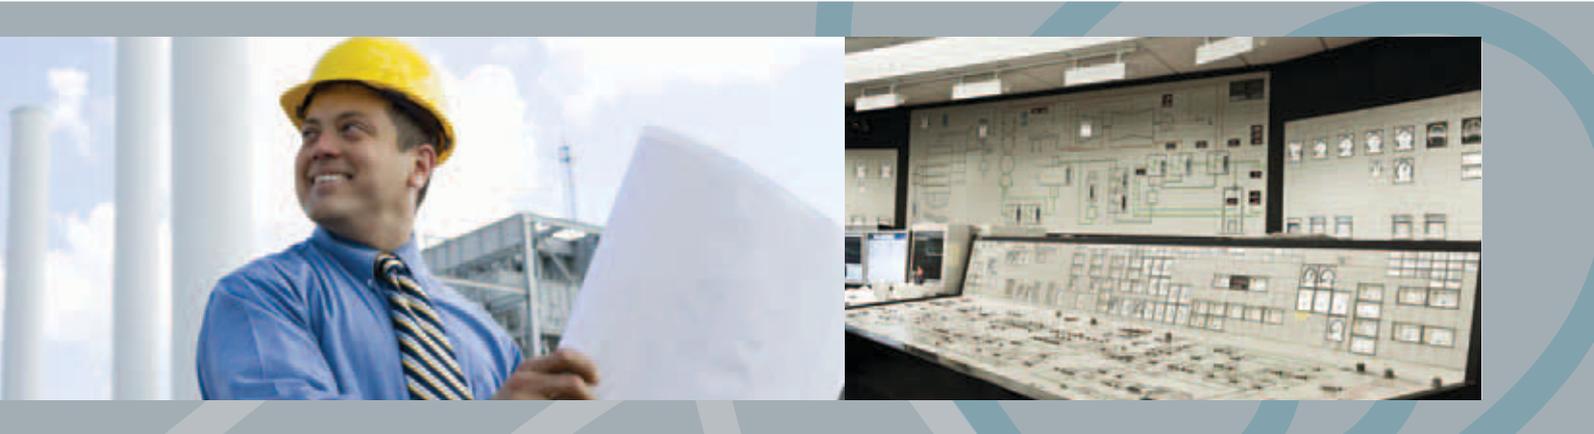

A short circuit anywhere in the complex infrastructure of a power plant can be disastrous. The right fire extinguishing solution can save lives and protect your equipment. INERGEN® systems limit fire damage, keep the power plants running and clean-up time to a minimum.

Prevents overheating

The primary cause of fires in electrical equipment is overheating. When released, INERGEN® lowers the room temperature and reduces the oxygen level, preventing overheating and reignition.

Fire protection of offshore installations with INERGEN® extinguishing agent

What is an INERGEN® system?

An INERGEN® system works by reducing the oxygen level. INERGEN® ensures that the oxygen concentration in the protected area is reduced so fire cannot survive.

INERGEN® has a 3D extinguishing effect, which means that even “hidden” fires are quickly and effectively extinguished.

An INERGEN® system distributes inert gas via pipework installed in ceilings or under raised floors. The pipe network ensures that INERGEN® is evenly distributed for optimal extinguishment.

INERGEN® systems can be tailored to customers' specific needs, and the cylinders can be installed either vertically or horizontally.

How does INERGEN® work?

INERGEN® is a patented air mixture. When it is released, the oxygen level in the protected area falls from 20,9 percent – the usual level in atmospheric air – to between 10 and 14 percent, thereby putting out the fire.

In the event of fire, vacate the area. If this is not possible, the unique composition of INERGEN® makes it possible for people to remain in the area while the fire is extinguished.

Benefits of INERGEN® system:

- Safe for the environment
- Safe for people and equipment
- Cost-effective and simple to maintain
- Effectively cools and prevents reignition

Fire extinguishing specialists

Fire Eater A/S specialises in developing fire extinguishing systems for industrial use.

Our systems are designed specifically to protect irreplaceable valuables where typical solutions such as water and chemicals will not suffice.
